99 Legalising assisted suicide: what does the evidence say?

Research made simple
100 Bias in research

Women's health
102 Feasibility and efficacy of an internet treatment for postnatal depression utilising a behavioural activation approach

Midwifery
103 Women admitted to hospital during pregnancy have increased risk of venous thromboembolism that persists up to 28 days postdischarge
104 Pregnancy obesity is associated with increased rates of all-cause mortality and cardiovascular hospital admissions in adult offspring
105 Psychoeducation for pregnant women with fear of child birth increases rates of spontaneous vaginal delivery, reduces caesarean rates and improves delivery experience
106 Higher coffee intake in pregnancy linked to prolonged gestation, and higher caffeine intake linked with babies being small for gestational age

Adult nursing
107 Earlier thrombolytic treatment is associated with better outcomes following acute ischaemic stroke
108 People receiving dialysis in the morning have better subjective sleep quality than those who receive dialysis at other times
109 Review: exercise interventions improve pain and function in people with knee osteoarthritis compared with no exercise

Child health
110 Parental–adolescent conversations that focus on weight are more likely to be associated with unhealthy weight-control behaviours in adolescents than conversations that focus on healthy eating
111 Parents of non-verbal children with learning disability (LD) most commonly recognise their child’s pain through vocalisations, social behaviour and facial expressions
112 Overweight or obese young people are not at increased risk of depression, but young people with depression are at increased risk of obesity

Health promotion
116 Few people living with and beyond cancer meet current exercise recommendations

Primary health care
117 A self-regulation protocol for people with COPD improves symptoms and reduces unscheduled physician visits

Nursing issues
118 Topical lidocaine–epinephrine–tetracaine is effective in reducing pain during laceration repair with tissue adhesive in children
119 No difference in patient satisfaction or quality of care provided by nurses or GPs for low-complexity primary care presentations
120 In menopausal women physical activity and taking dietary supplements may protect against coronary artery disease
121 Caring behaviour of nurses in Malaysia is influenced by spiritual and emotional intelligence, psychological ownership and burnout
122 Higher levels of nurse staffing are not associated with reduced adverse events among postoperative children if surveillance levels are low

Care of the older person
123 A model to develop compassionate relationship-centred care between older people, relatives and staff identifies seven factors necessary to promote appreciative caring conversations
124 Around a quarter of all older people have disability during the last 2 years of life, with prevalence higher among women and those aged over 80 years
125 Exercise-based fall prevention programmes decrease fall-related injuries
126 Healthcare professionals may not be maintaining person-centred care for people with dementia hospitalised on acute wards

October 2014 Vol 17 No 4

113 Although parents are generally satisfied with their child's postoperative care, children continue to experience moderate-to-severe pain postoperatively
114 Child-spanking at age 5 may have a detrimental effect on child externalising behaviour and cognitive development at age 9
115 Infrared thermometers for assessing fever in children: the ThermoScan PRO 4000 ear thermometer is more reliable than the Temporal Scanner TAT-500
