Cover
Addictive behaviors are linked to reduced activation of the "reward system" of the brain. However, it is not known whether risk-seeking behaviors, separate from addiction, are also associated with changes in the brain's reward system, which may explain their common co-occurrence. Schneider et al. (p. 39) studied risk-taking bias in 266 healthy 14-year-olds and found that increased risk-taking behavior in an experimental setting predicted later substance abuse in adolescents. Cover design by Steve Hennessey.
